Document Type: Data

Department/Program: Information Technology and Network Services, Virginia Institute of Marine Science

Publication Date: December, 2021

Description: Digital files of rainfall and runoff event data for the Ware River Watershed, Gloucester Virginia. April 1979 through July 1981.

Abstract: The Ware River is a small coastal estuary draining into the Chesapeake Bay estuary. VIMS monitored the Ware watershed for rain events, runoff, and impacts to the estuary from April 1979 through July 1981. This entry contains the estuarine receiving water quality monitoring data files for the portion of the study known as Part 2 – Estuarine Receiving Water Quality. A set of stations on the tidal estuarine portion of the river were sampled by-monthly during high slack tide events. The stations were also sampled during 24-hour 'intensive surveys' and immediately following storm events to document impacts. Methods and results are documented in the related literature. Data files were processed using SAS ver. 9.4 software (Statistical Analysis System, SAS Institute, Inc.) and are provided in Text (.csv) format. The SAS scripts used for processing and original data files are also provided. See the readme.txt file for data dictionary and further data processing information.

README File

Overview

VIMS monitored the Ware watershed for rain events, runoff, and impacts to the estuary from April 1979 through July 1981. This entry contains the estuarine receiving water quality monitoring data files for the portion of the study known as Part 2 – Estuarine Receiving Water Quality. A set of stations on the tidal estuarine portion of the river were sampled by-monthly during high slack tide events. The stations were also sampled during 24-hour 'intensive surveys' and immediately following storm events to document impacts.

Supporting Documentation

Results of the study, project plan, and methods and materials, appear in the final project report to the US EPA at this link:
Bosco, C., Anderson, G. F., & Neilson, B. (1982) Ware River intensive watershed study - Part 2. Estuarine Receiving Water Quality. Virginia Institute of Marine Science, William & Mary. https://doi.org/10.25773/w1ge-9c78

Data Processing Steps

Original digital files were processed using SAS ver. 9.4 software (Statistical Analysis System, SAS Institute, Inc.) and converted to text (.csv) format. The SAS scripts used for processing and original data files are also provided. Each dataset consisted of two 'pages' of data records since storage limits at the time (1980) restricted file size to 80 characters. These two pages were merged together using the SAS script and then written to a .csv file. The original files were unedited and are also provided. The following is a cross reference of original .data files and the processed .csv files:

Original filename	Description	Merged .csv filename
wchem1.data, wchem2.data	Data files of Slack Surveys	Ware_SlackSurvey_WQ.csv
i79chem1.data, i79chem2.data	24 hour survey WQ Data	Ware_24HrSurvey79_WQ.csv

Along with the original datafiles, the original SAS format statements are also provided for each. The naming convention placed the text 'sas' as a prefix in front of each corresponding data file. For example, saschem1.data, saschem2.data, and so forth. See the original datafile folder for this information.

Original files NOT processed

For the estuarine studies numerous ancillary measurements were conducted during the three year project. These files were not converted to .csv format. The studies include sediment BOD measurements, sediment grain size, phytoplankton cell counts, tide gage records, and special surveys in Mobjack Bay. These files are provided along with the SAS format statements for each. See the EPA report for further details.
