Virginia Department of Game and Inland Fisheries
PERFORMANCE REPORT (July 1, 1992 - June 30, 1993)

Project:	Nongame & Endangered Species Investigations	No:	WE99R-2
Study:	Bird Conservation	No:	IV-1
Job:	Bald Eagle Studies	No.	A-F
Personnel:	Mitchell Byrd, Dana Bradshaw, Karen Terwilliger, Keith Cline	Costs	
		Total:	\$27,000
		State:	\$ 6,750
		Fed'l:	\$20,250

Status/Recommendations: On schedule, continue study

Summary:

Aerial and ground surveys resulted in the location of 151 active nests. Of the 151 nests of known outcome, 99 were productive and 52 were unproductive. A total of 173 young was produced with an average production of 1.15 fledglings per active nest and 1.75 fledglings per productive nest.

Shoreline surveys in the James River and Potomac River concentration areas were continued.

Landowner lists were completed for nests found in the 1993 survey.

Objective A: To conduct a winter inventory of bald eagle numbers including age composition of this population.

Findings:

This job was inactive during the 1992-1993 fiscal year.

Objective B: To determine hatching and fledgling success of eagles in Virginia.

Findings:

Aerial surveys were conducted in January, February, March, and May to locate active nesting territories and to determine the number of young produced. May surveys were conducted after young were large enough to be observed with more certainty from the air. Surveys were conducted throughout Tidewater Virginia and the Eastern Shore.

Aerial surveys resulted in the location of 151 active nests. All active nests were plotted on 7 1/2 minute topographic sheets. Data on the 151 nests and productivity trends for 1977-1993 are presented in Table 1. Productivity by river systems is shown in Table 2.

Table 1. **Bald Eagle productivity in Virginia for the period 1977-1993.**

Year	Total Active Nests	Total Prod. Nests	Total Unprod. Nests	Percent Nest Prod.	Total Young Fledged	Fledglings Productive Nest	Fledglings Active Nest

2	20	26	28	80	73	68	28	37	32	1.75	1.96	1.68	1.40	1.42	1.14
3	32	38	44	84	63	66	43	37	48	1.59	1.54	1.66	1.34	0.97	1.09
4	37	43	43	54	56	70	54	58	58	1.70	2.41	1.93	1.47	1.34	1.35
5	10	10	17	80	50	39	12	8	12	1.50	1.60	1.71	1.25	0.80	0.67
	111	131	151	85	63	66	157	142	173	1.67	1.71	1.75	1.41	1.08	1.15

Of the 151 nests of known outcome, 99 were productive and 51 were unproductive. The total number of young produced was 173. Assuming that all young fledged successfully, average production was 1.15 fledglings per active nest. The number of young per productive nest was 1.75, almost identical to that of 1992.

The percentage of successful nests (66%) was essentially the same as in 1992 (63%). In both 1992 and 1993 there were sustained periods of heavy rains during egg laying and hatching, perhaps contributing to the somewhat low success rate. Of the 99 productive pairs, eight produced three young each, 58 produced 2 young each, and 33 produced one young each.

Objective C: To identify ownership of nesting areas and concentration areas of bald eagles during the summer and winter season and to develop management agreements and protection strategies where possible for these areas. These areas will be monitored regularly as deemed necessary.

Findings:

A land ownership list was completed for new and relocated nests which were found during the 1993 survey season. Ownership plats of properties surrounding each active nest were identified through courthouse records and a map of each site was drawn. These maps reflect nest locations as well as surrounding properties in order that management plans reflect all properties

involved in the protection of nest sites.

Objective D: To monitor eagle concentration areas on the James, Rapahannock, and Potomac Rivers and to determine the influence of human activity where possible.

Findings:

Shoreline surveys were conducted on the James weekly beginning the first week of June. Peak counts were reached (138) in early June and have declined since, the reverse of the normal pattern. Surveys are now being conducted to determine if eagles from this major roost have shifted their foraging areas to a different section of the James River.

In 1993, a collaborative study with the Division of Parks was initiated to resurvey the Potomac River eagle concentration area. The original routes which were surveyed in 1983 have been replicated twice per week since mid-May. A final report on these studies will be completed at the end of the summer.

Objective E: To make an intensive study of the bald eagle population and occupied habitat on the James River and to develop an overall management plan.

Findings:

Studies have been conducted since mid-May at several locations near the Wilcox Wharf area to attempt to assess the impact of bald eagle foraging. A report on this study will be end of the summer.
