Marine Resource Report No. 83-8

August 1983

President Reagan's recent proclamation of a 200 mile Exclusive Economic Zone (EEZ) has again called attention to the United States' desire to exploit the abundant natural resources of the continental shelf. U.S. fishery policy has focused on the full utilization of the fishery resources found within the 200 mile limit since the passage of the Magnuson Fishery Conservation and Management Act of 1976 (FCMA). Because most commercially important species are being fished at the maximum sustainable yield (MSY), there has been an increased emphasis on the development of new species -- the so-called "underutilized species".

Foreign fishing fleets have played a prominent role in initiating the development of underutilized species. Their success in harvesting, processing, and marketing these species clearly demonstrates that profitable commercial opportunities are available to U.S. fishermen. U.S. fishery management agencies are working diligently to promote the expansion of domestic harvesting and processing capacity to enable our fishing industry to take advantage of these developing opportunities.

Joint ventures are one tool being used by Regional Fisheries Management Councils to aid in the transition to a fully functional domestic fishing industry. Joint ventures are designed to enable U.S. fishermen to gain valuable experience in harvesting underutilized species and to aid in the transfer of fishing technology from foreign fishermen. In addition, they permit foreign governments to gradually phase out their fishing operations in the fishery conservation zone

(FCZ) while maintaining an adequate supply of fishery products. The regional councils believe that these partnerships are an intermediate stage in the gradual evolution of domestically owned and operated fishing companies.

There is considerable debate over the use of joint ventures as a method to increase our ability to exploit underutilized species in the FCZ. It is beyond the scope of this paper to address all of the issues involved in the controversy. We have chosen instead to focus on an issue of primary interest to U.S. fishermen and fishery managers: the expected return to the joint venture harvesting vessel.

The purpose of this analysis is to compare the expected returns of a U.S. flag vessel fishing independently for squid to those of a U.S. vessel fishing for squid in a joint venture arrangement. The report will aid fishermen in deciding whether or not to target squid as a part of their total fishing effort. Additionally, if squid is targeted, each fisherman will be able to determine which option is best for him -- fishing independently or in a joint venture group. Resource managers will be able to use the information as one element in the total decision matrix as they try to determine the best policy for the development of the U.S. squid resource.

Assumptions

I. Independent Fishing Vessel

- A) It is assumed that the vessel will have a seven day turnaround, i.e. it will complete a fishing trip, return to port to off load and be ready to sail every seven days.
- B) During each seven day trip 4 days will be spent harvesting squid.
- C) The sixty foot vessel will be manned by 4 individuals including a captain. (90'-10 men)
- D) The sixty foot vessel will cost approximately \$400,000 (90' - \$1,100,000). This figure includes all electronics and fishing gear.
- E) The vessel will be financed over 20 years at 12%. It is assumed that owner's equity will be 20% or \$80,000. (90' - \$220,000).
- F) Fuel consumption for the 60' vessel is estimated at 250 gallons per day at \$1.00 per gallon. (90' - 350 gallons per day). The independent vessels have been assessed a surcharge equal to day of fuel usage per fishing trip. This surcharge has been assessed to account for more extensive travel to and from the fishing grounds and the fact that these vessels will have to carry their catch on board while fishing and traveling to port.
- G) Food is estimated at \$7.50 per man per fishing day.
- H) Ice has been estimated at 9 tons per trip at \$25 per ton for the 60' vessel. (12 tons per trip for the 90' vessel)
- I) Crew share is 30% of the modified gross revenue. Modified gross revenue is the gross revenue less the fuel, ice, and food expenses.
- J) Insurance is estimated at 2.5 percent of the original hull cost and \$1000 per man on an annual basis.
- K) Maintenance and repair costs are estimated at 8 percent of the hull cost on an annual basis.

- L) General and Administrative Expenses (G&A) is estimated at 2.5% of gross revenues. This expense will cover professional fees, interest on working capital, office expense, miscellaneous expenses, etc.
- M) Total fishing days are estimated in the following manner.
 - 1) Each month is assumed to have 30 days.
 - 2) The total number of months dedicated to squid fishing are multiplied times 30 to days give you the total available fishing days in the season.
 - 3) The total number of fishing days is divided by the total days it takes to complete a fishing trip. (i.e.-7 days for an independent vessel). This indicates the total number of expected trips in a season.
 - 4) The total number of trips is multiplied times the number of fishing days per trip (i.e. 4 days for the independent vessel). This gives the total number of fishing days per season.
 - 5) The total number of fishing days has been reduced by five percent to reflect the fact that the vessel may experience mechanical difficulties or poor weather conditions. This is an addition to normal port time allocated in the fishing plan.
- N) The vessel will receive \$.35 per pound for Loligo and \$.15 per pound for Illex.
- O) Docking fees are not assessed to independent fishermen because it is assumed that the onshore processor will provide temporary dock space as is the tradition in the Mid-Atlantic Region.
- P) Utility and phone expense is estimated at \$75 per month.
- Q) Vehicle fuel and maintenance expense is estimated at \$150 per month.
- R) Supply expense is estimated at \$100 per month.
- S) Captain/owner's salary is provided at \$40,000 per year. This wage covers all living expenses and taxes.
- T) The Break-even Point is calculated by using the following equation:

$$\text{BEP} = \frac{\text{Total Variable Expenses (Less Crew Share)} + \text{Total Fixed Expenses}}{1 - \text{Crew Share}}$$

The Break-even Catch is calculated by using the following equation:

$$\text{BEC} = \frac{\text{BEP}}{\text{Price Per Lb. Of Squid}}$$

The Break-even Catch Per Fishing Day is calculated using the following formula:

$$\text{BEC/FD} = \frac{\text{BEC}}{\text{Total Number Of Available Fishing Days In A Season}}$$

- U) Depreciation was estimated using a 10 year expected life and the straight line depreciation method. New vessels would be expected to use the new ACRS depreciation schedules currently in effect. These accelerated depreciation techniques tend to distort revenue projections so I have chosen to use the straight line method to give projections that are constant over time.
- V) All returns are estimated before tax due to the wide variation in tax rates experienced by fishermen in the Mid-Atlantic region.
- W) It is assumed, that all vessels will fish for 10 hours per day.

II. Joint Venture Vessel

- A) Joint venture assumptions will remain the same as independent fishing assumptions except as noted.
- B) Joint venture vessels will fish on a 14 day rotation. There will be 10 fishing days and 4 days off for travel, off loading and restocking the vessel.
- C) It is assumed that the joint venture vessels will not require ice on board because cod ends will be off loaded directly onto the mother ship and freezer space will be adequate for 10 days of food provisions.
- D) Vessel and gear maintenance expense is estimated at 7% to account for less wear and tear on vessel due to fewer trips to port and the fact that the vessel will not have to carry it's catch on board.
- E) Joint venture vessel are projected to receive \$.125 per lb. for Illex squid and \$.30 per lb. for Loligo squid.

Conclusion

This analysis reveals that fishermen involved in joint venture operations realize a higher return on investment than their independent competitors. The advantage results primarily from the joint venture operator's ability to remain at sea for extended periods of time while the independent operator must return to port more frequently to maintain a high quality product for shoreside processors. Because he unloads his catch directly onto foreign processing vessels, the joint venture fisherman is not limited by quality constraints. He is only limited by his ability to store adequate fuel and provisions, as well as his ability to maintain a high level of productivity.

Smaller fishing vessels have a competitive advantage over larger vessels in the squid fishery. Their lower fixed and variable costs permit them to achieve their break-even point at a much lower level of catch. This lower break-even point renders them less vulnerable to cyclical downturns in stock size or changing economic conditions. These factors, coupled with their lower equity requirements and higher expected returns, result in a lower level of risk for smaller vessels operating in the squid fishery.

This report should prove to be a useful tool for industry members as well as those charged with managing the squid resource. It contains baseline information that can be used by fishermen to determine whether they should enter this fishery and if they do target squid, in their decision to fish independently or in a joint venture

group. Resource managers can use the information to help make their decisions concerning future U.S. policy towards joint ventures.
