VIMS Marine Resource Report No. 2021-4

September 22, 2021

The Virginia Institute of Marine Science (VIMS) conducted high resolution sea scallop dredge surveys of the Mid-Atlantic (MAB), the Nantucket Lightship (NLCA), Closed Area I (CAI), and Closed Area II (CAII) during May - July 2021 (Figure 1). These surveys were funded by the Sea Scallop Research Set-Aside Program (RSA). Exploitable biomass for each survey is shown in Table 1 for each SAMS Area (Scallop Area Management Simulator). SAMS Areas represent management relevant spatial subunits of the resource and explicitly account for differences in recruitment, vital rates, and fishing effort in the forward projection of survey information. This information is used to provide information in the development of alternatives for the annual specifications process. Maps of SAMS Areas are provided in Figures 2 - 5. At the time of the surveys, exploitable biomass estimated from the commercial dredge was 2,316 mt or 5.1 million pounds for the ET Open SAMS Area and 1,230 mt or 2.7 million pounds in the ET Flex SAMS Area. For open bottom in the LI SAMS Area, exploitable biomass was estimated at 7,123 mt or 15.7 million pounds. In the NLCA South Deep SAMS Area, the exploitable biomass was 5,350 mt or 11.8 million pounds. The exploitable biomass estimate for the CAII SW SAMS Area was 15,695 mt or 34.6 million pounds. The CAII Extension (Ext) estimate was 6,220 mt or 13.7 million pounds.

The MAB survey was conducted aboard two commercial vessels: *F/V Carolina Capes II* and *F/V Carolina Boy* during May 2021. Each vessel completed one survey leg and occupied a total of 450 stations throughout the MAB survey area. The CAI and CAII survey was conducted onboard the *F/V Norseman* in June 2021 and a total of 125 stations were completed. The *F/V Celtic* conducted the NLCA survey during June 2021 and occupied a total of 135 survey stations. All vessels were able to tow two dredges simultaneously, with a NMFS 8-foot survey dredge on one side of the vessel and a 14-foot Coonamessett Farm Turtle Deflector

Dredge (CFTDD) on the other. While the comparison of catches between the survey dredge and the commercial dredge are informative on a relative basis, for the purposes of this report, we present only the catch data from the commercial dredges as this information is more applicable to the resource conditions that the industry is likely to encounter. Dredge catch data were obtained during standardized 15-minute survey tows at a speed of 3.8 - 4.0 kts with a 3:1 scope to depth ratio (Table 2).

Catch data in tabular form is shown in Table 2. The number of scallops caught was partitioned into three shell height size classes (<35 mm, 35–75 mm, and >75 mm) for each station (Figures 6 – 8). Figures 9 - 11, show the shell height frequency distribution from both dredges (survey and commercial) for each SAMS Areas.

In addition to the catch data that informed our understanding of scallop abundance and biomass, we also monitored meat quality during each survey. This allowed us to determine the prevalence and intensity of a parasitic nematode observed in the scallop meat and monitor for other diseases that may impact meat quality and yield. Infected scallops typically present with rust colored lesions on the exterior of the adductor muscle, often opposite the sweet meat. Nematode infected scallops were observed only during the MAB survey with a typical number of nematodes observed per scallop meat ranging from 1- 9. The spatial distribution of the nematode prevalence (percent of sampled scallops at a given station with at least one lesion) by year for 2015 - 2021 is shown in Figure 12. From 2016 - 2020, nematode infected scallops have been detected in the HCS, although the distribution is patchy and prevalence is low (20 percent or less of scallops are infected). The distribution of infected scallops observed in 2020 and 2021 was spatially broader as compared to 2019. In 2021, the ET Open and ET Flex SAMS Areas were identified as hot spots with high proportions of infected

scallops, as well as the greatest number of lesions observed per scallop. The distribution of infected scallops in these two areas was patchy in terms of the number of lesions observed per scallop. A higher percentage of infected scallops were also observed in the HCS SAMS Area in 2020 and 2021. The number of infected scallops in the southern portion of the resource area has continued to decline since 2018. This decline may be related to a decline in biomass in the southern portion of the resource. Very few infected scallops were observed in the MAB Nearshore, NYB or the open areas off of LI and BI.

In addition to monitoring nematode infected scallops, we also recorded the presence and severity of shell blister disease (Figure 13). This disease can reduce yield and lower meat quality, and has typically been found in larger scallops in deeper water. For the past two years (2020 and 2021), there has been an increase in the number of scallops with shell blister disease observed in the MAB. The highest percentage of scallops with this disease have been documented in the ET Open (30 percent), ET Flex (25 percent), and HCS (28 percent) SAMS Areas. The spatial distribution of infected scallops has also expanded in 2021 and 2020 compared to 2019 (Figure 14). A greater percentage of scallops with shell blister disease have been observed in the ET Open, ET Flex, and HCS SAMS Areas, as well as in the open bottom in LI.

Table 1: Exploitable biomass as estimated from scallops captured in the commercial dredges during the VIMS/Industry cooperative surveys by survey and SAMS Area during May - June 2021.

Survey	SAMS Area	Exploitable Biomass (mt)	95% CI Lower Bound	95% CI Upper Bound

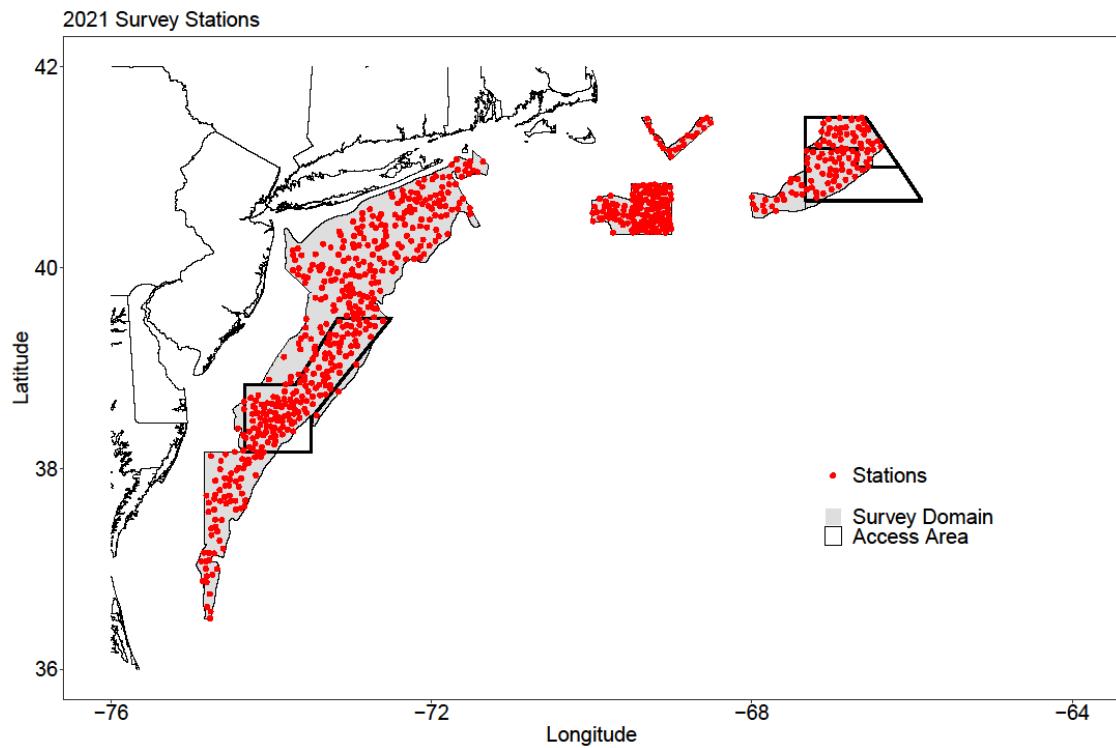

Figure 1: Survey domains with station locations for the VIMS/Industry cooperative surveys of the Mid-Atlantic sea scallop resource area, the Nantucket Lightship, Closed Area I, and Closed Area II completed during May - June 2021.

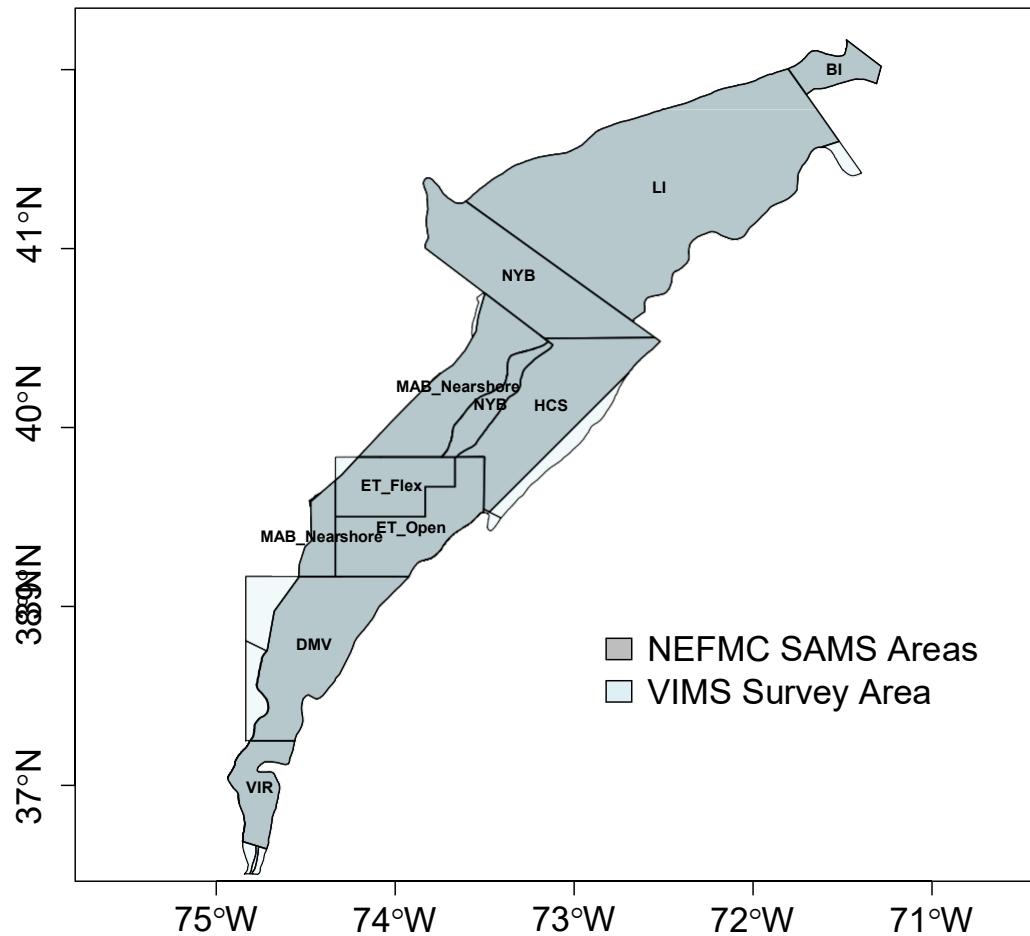

Figure 2: SAMS Areas used to calculate biomass estimates for the VIMS/Industry cooperative survey of the Mid-Atlantic sea scallop resource during May 2021.

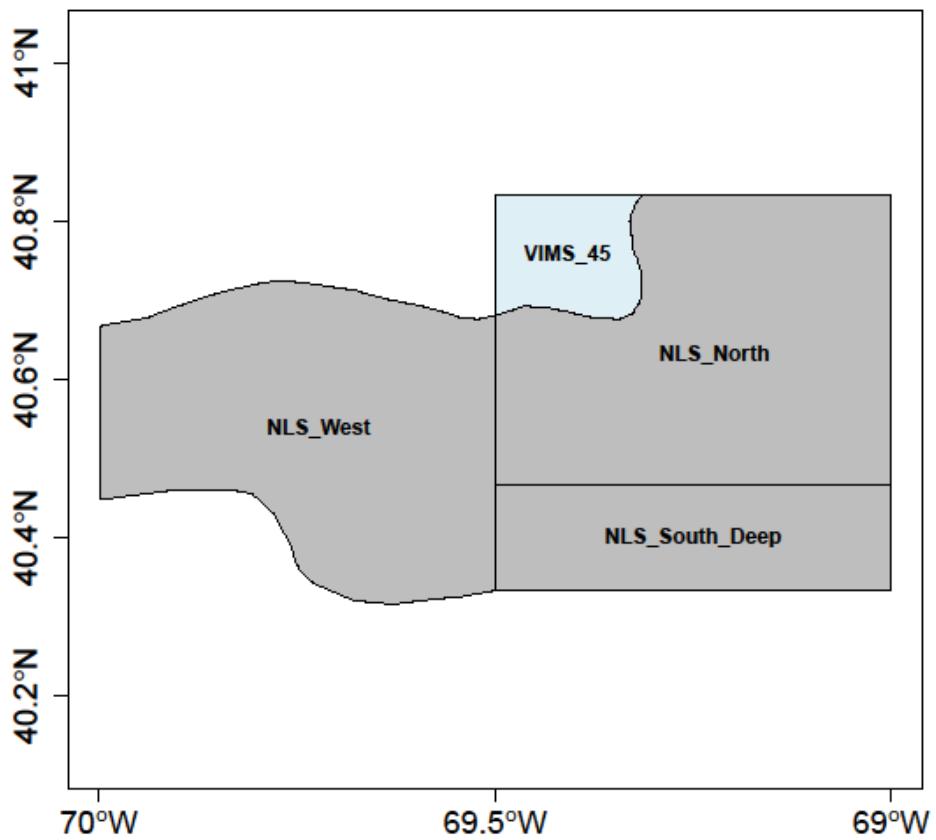

Figure 3: SAMS Areas used to calculate biomass estimates for the VIMS/Industry cooperative survey of the Nantucket Lightship during June 2021.

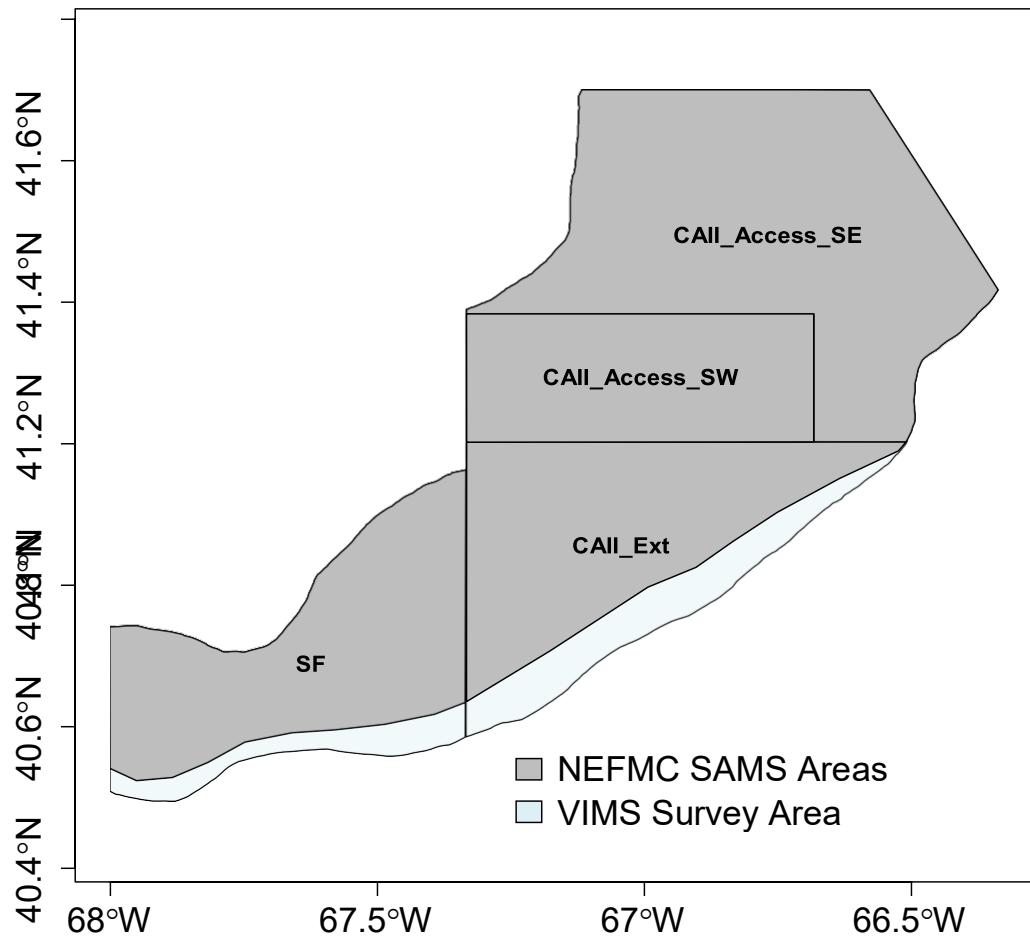

Figure 4: SAMS Areas used to calculate biomass estimates for the VIMS/Industry cooperative survey of the Closed Area II access area and open area along the southern flank during June 2021.

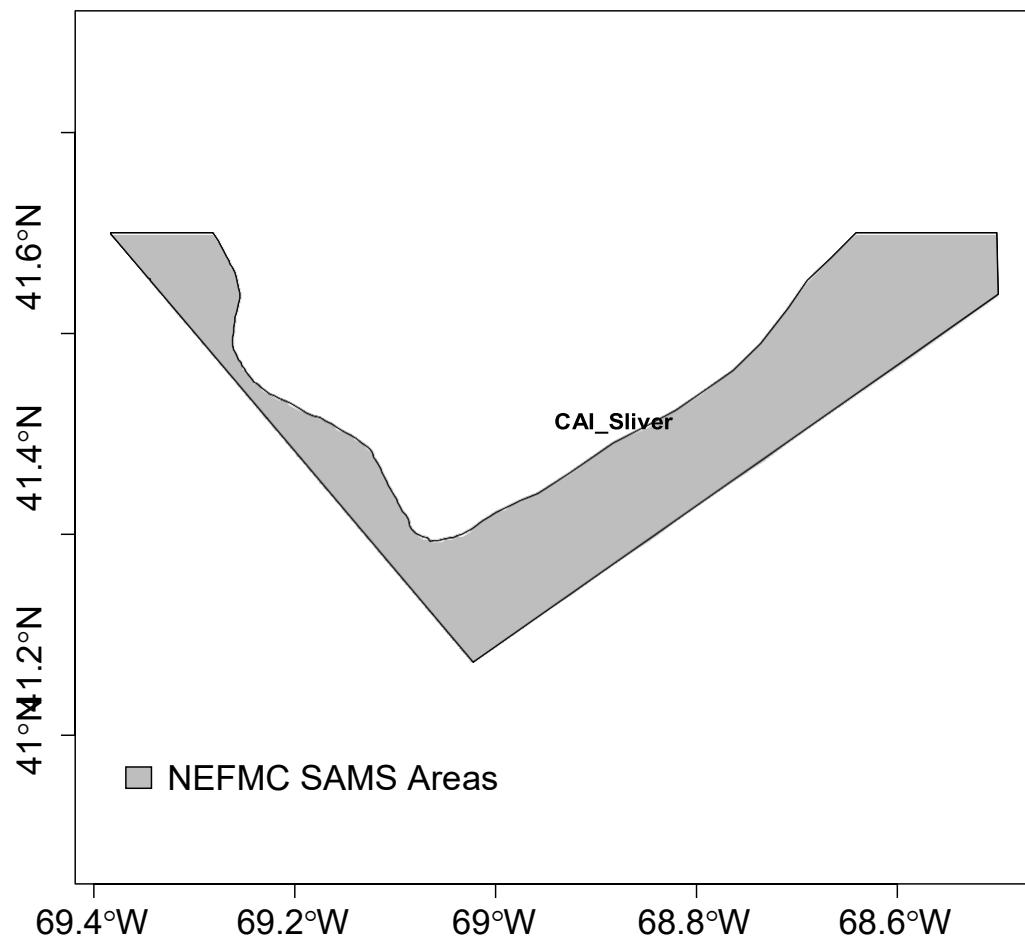

Figure 5: SAMS Area used to calculate biomass estimates for the VIMS/Industry cooperative survey of the Closed Area I access area during June 2021.

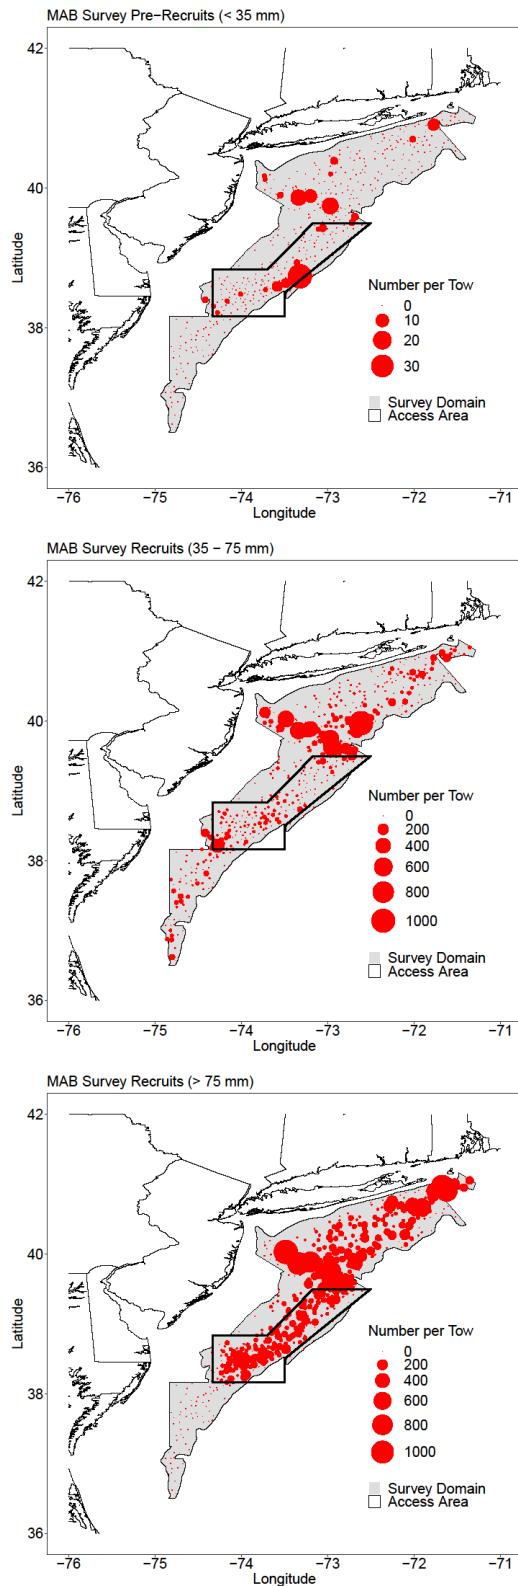

Figure 6: Number of scallops at shell heights of <35 mm, 35–75 mm, and >75 mm caught in the NMFS survey dredge during the VIMS/Industry cooperative survey of the Mid-Atlantic sea scallop resource during May 2021.

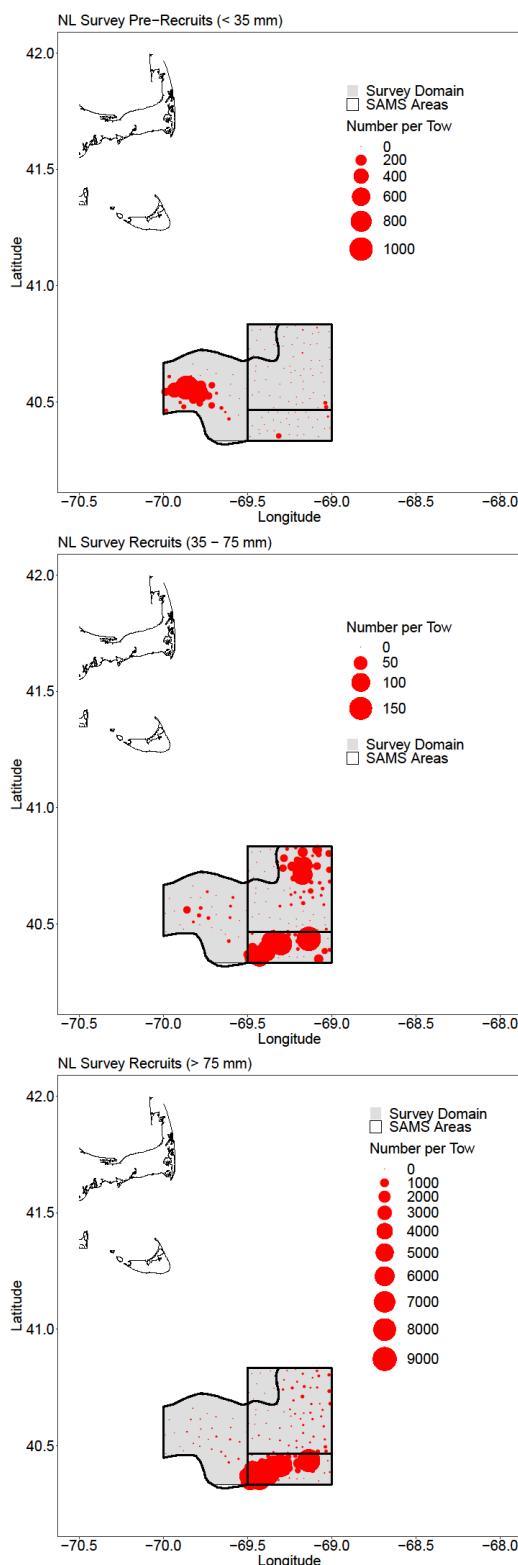

Figure 7: Number of scallops at shell heights of <35 mm, 35–75 mm, and >75 mm caught in the NMFS survey dredge during the VIMS/Industry cooperative survey of the Nantucket Lightship during June 2021.

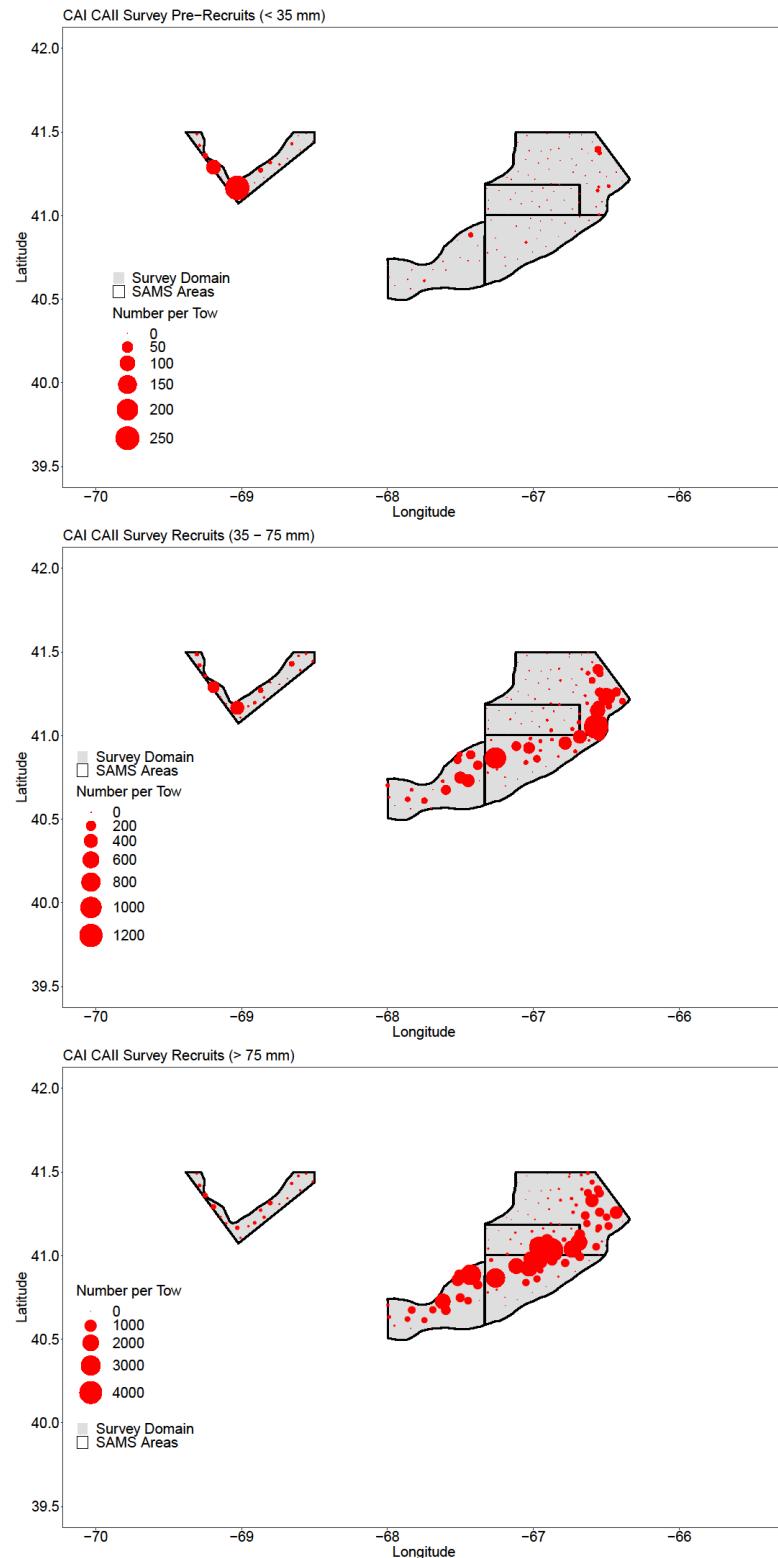

Figure 8: Number of scallops at shell heights of <35 mm, 35–75 mm, and >75 mm caught in the NMFS survey dredge during the VIMS/Industry cooperative survey of the Closed Area I and II during June 2021.

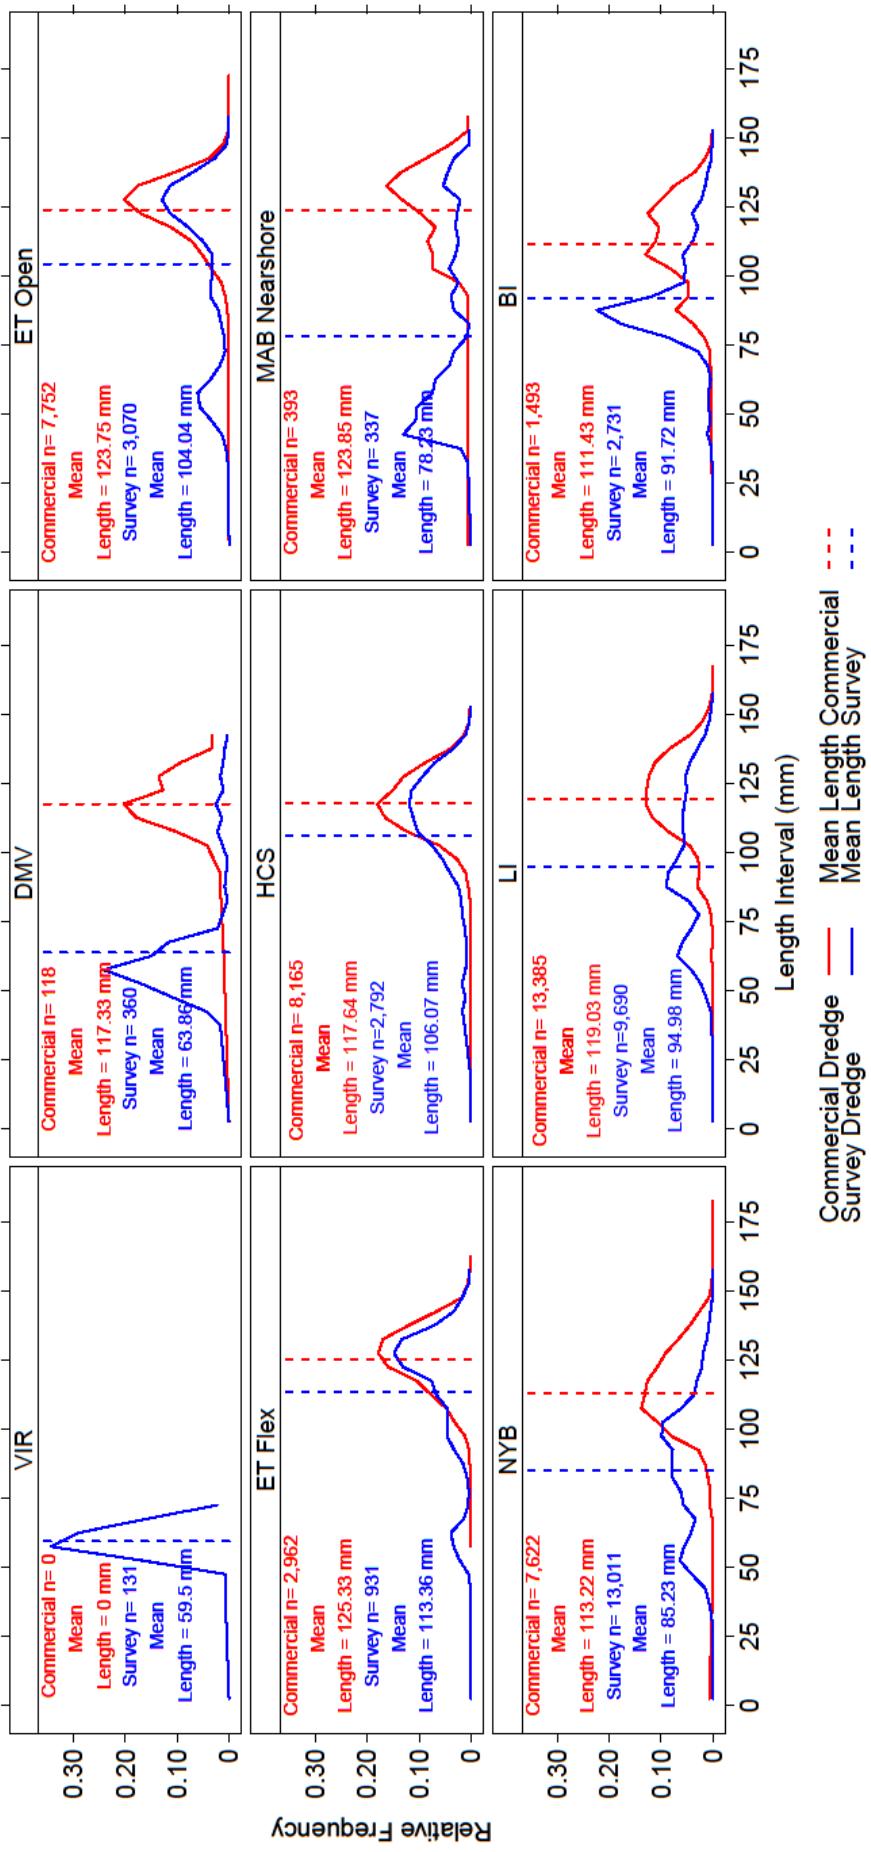

Figure 9: Scallop length frequency distributions generated from catch data obtained from both the survey and commercial dredges during the VIMS/Industry cooperative survey of the Mid-Atlantic sea scallop resource area in May 2021 by SAMS Area. Number of scallops (n) measured and mean length by gear are also included.

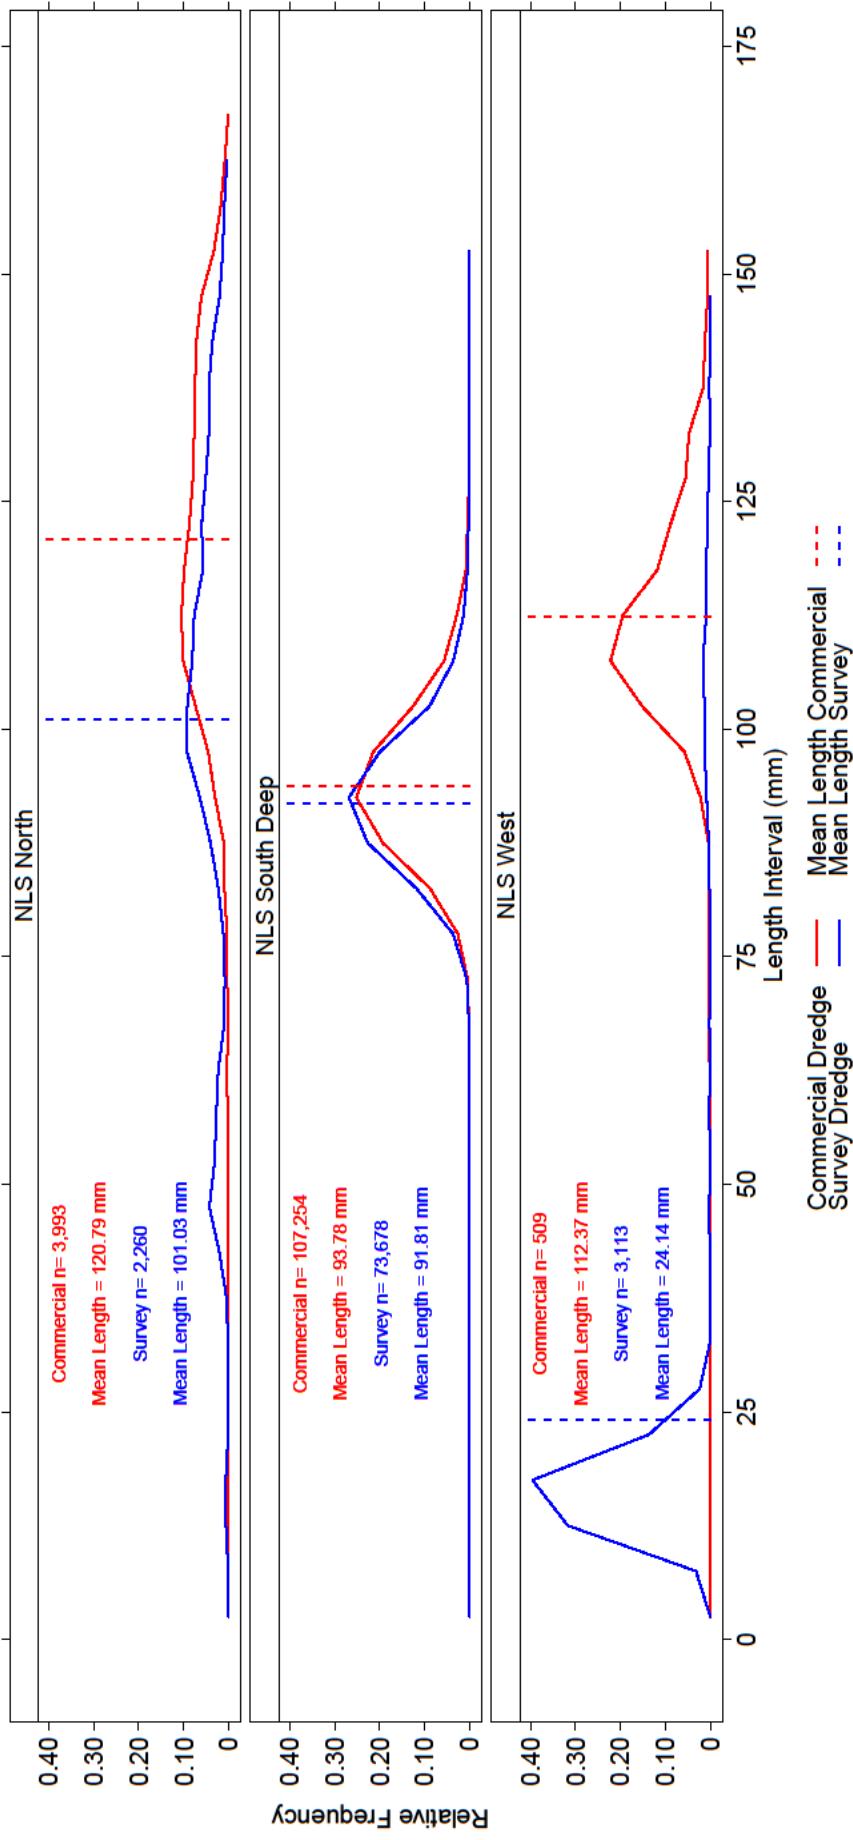

Figure 10: Scallop length frequency distributions generated from catch data obtained from both the survey and commercial dredges during the VIMS/Industry cooperative survey of the Nantucket Lightship survey in June 2021 by SAMS Area. Number of scallops (n) measured and mean length by gear are also included.

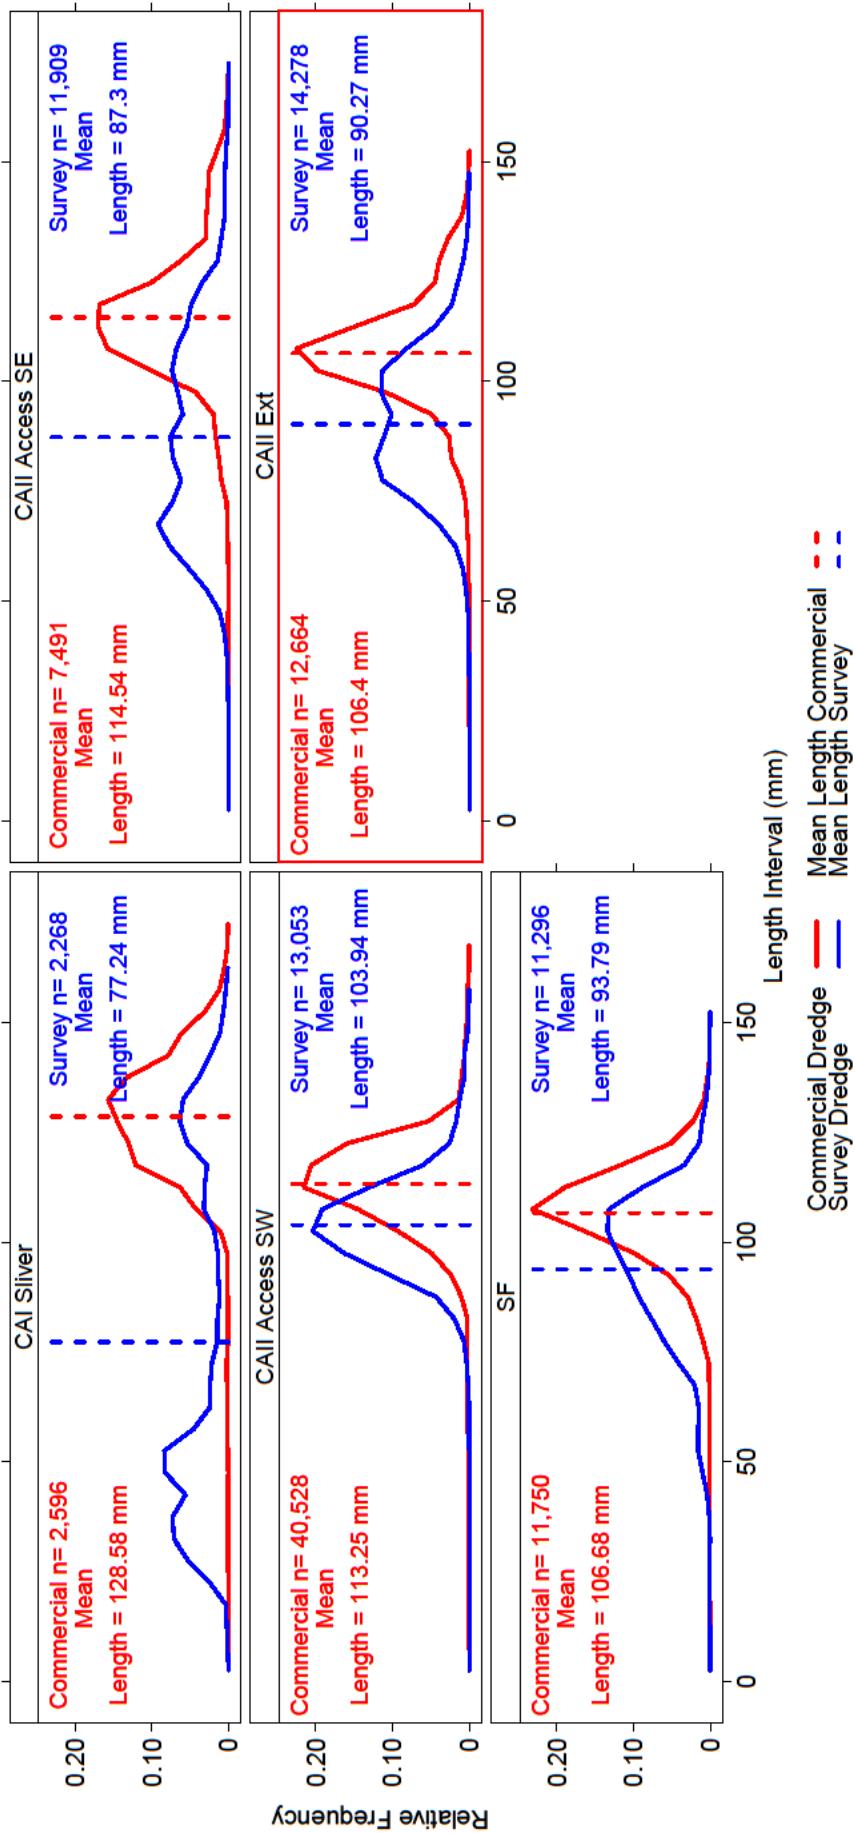

Figure 11: Scallop length frequency distributions generated from both the survey and commercial dredges during the VIMS/Industry cooperative survey of Closed Area I (top row) and Closed Area II (middle and bottom rows) in June 2021 by SAMS Area. Number of scallops (n) measured and mean length by gear are also included.

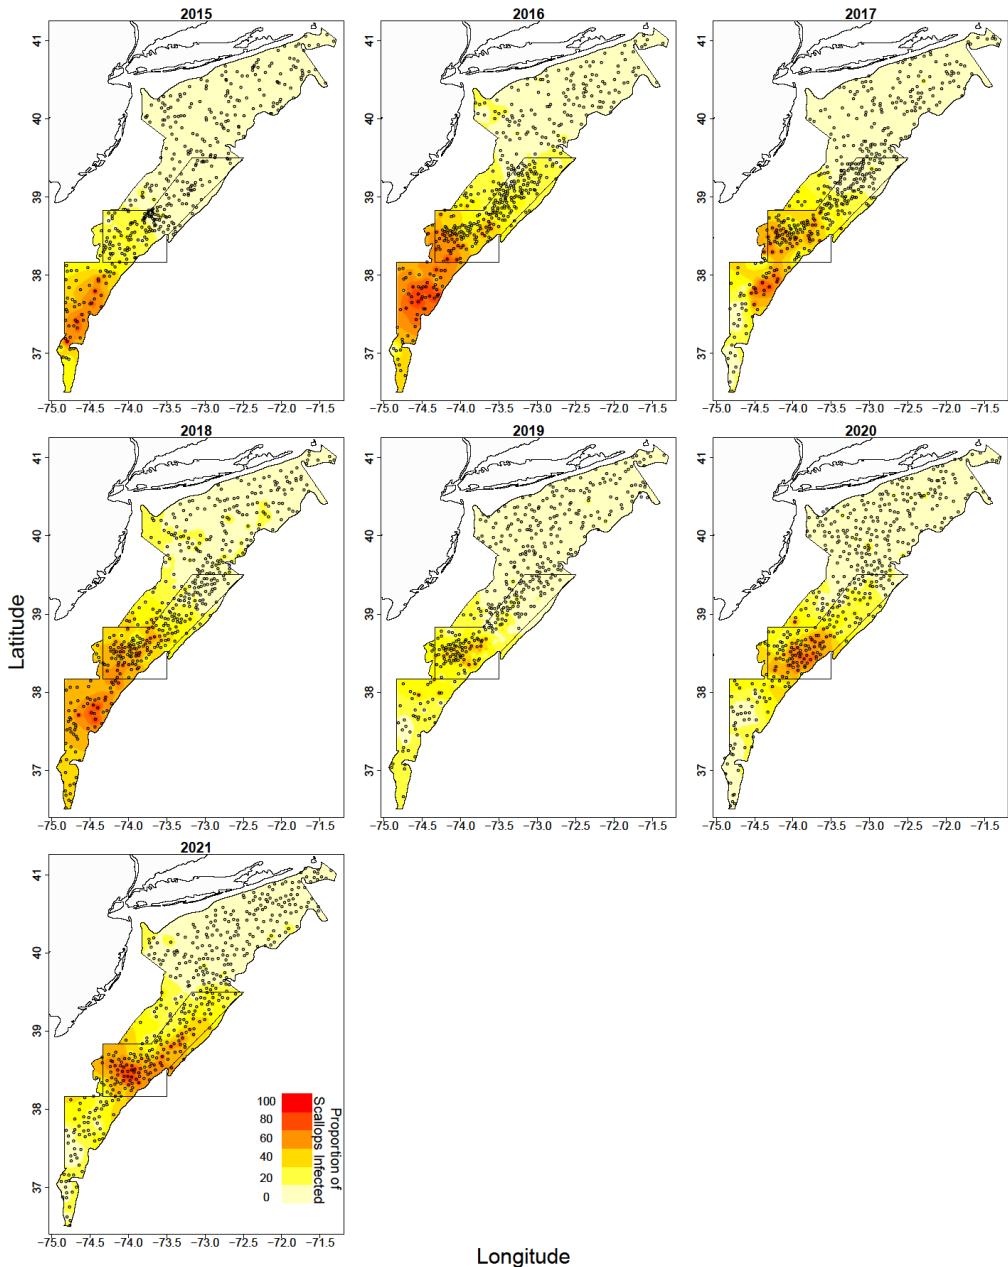

Figure 12: Proportion of scallops infected with nematodes for 2015 - 2021 in the VIMS/Industry cooperative survey of the Mid-Atlantic sea scallop resource area.

Figure 13: Images of a scallop with severe shell blister disease on the left and a scallop with no shell blister disease on the right.

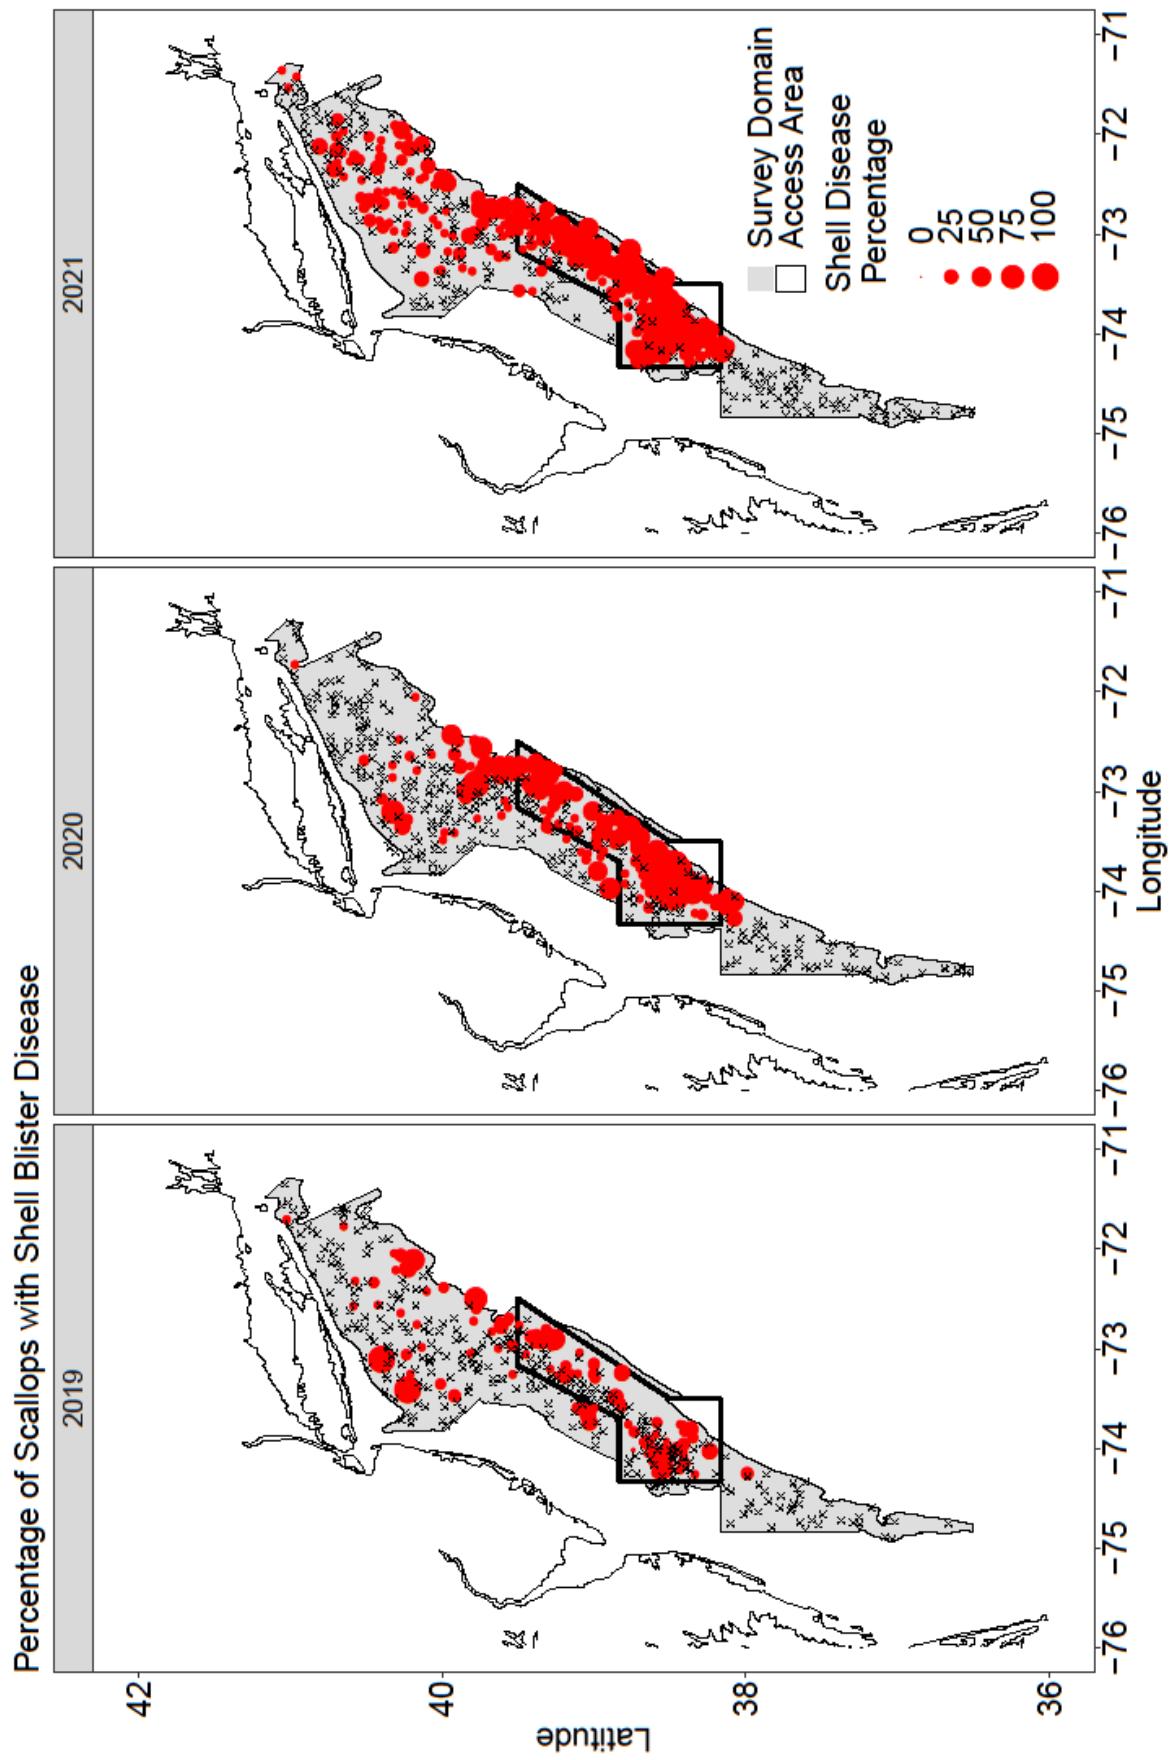

Figure 14: Proportion of scallops infected with shell blister disease for 2019 - 2021 in the VIMS/Industry cooperative survey of the Mid-Atlantic sea scallop resource area.
