Virginia Marine Resource Report 86-1

CBSAC WORKING GROUP ON DATA IDENTIFICATION AND INTERPRETATION
DATA SET INVENTORY REQUEST

Documentation of Virginia Juvenile Finfish Distribution and Abundance Survey

The VIMS data file CURRENT.STATION.FILE contains about 60,000 records of catch of juvenile fishes made with either a 16' or 30' semi-balloon trawl in the York, James, Rappahannock, and Potomac Rivers, as well as Chesapeake Bay, and Atlantic Ocean. These data span the years 1955 to 1984. It contains along with data on catch of juvenile fishes, hydrographic data. Summarization of this data file for the 30' trawl is presented in APPENDIX A, and for the 16' trawl in APPENDIX B. These appendices provide documentation of the location and time of the samples, gear type, and vessel. Gear codes used in these files are presented in APPENDIX C, and vessel codes in APPENDIX D.

A sister data file, CURRENT.LENGTH.FILE contains corresponding length measurements from sub-samples of the fish taken. Jointly, the two files can be used to determine the length frequencies for the sample, and then to derive the percentage of each age for each species taken. This enables one to establish an index for young-of-the-year fish by species.

Chesapeake Bay

Virginia's portion of Chesapeake Bay, including the Eastern Shore, has been sampled from 1955 to 1984, but in the early years the Bay was sampled as an extension of the York River ten miles out from its mouth. Between 1975 to 1979, the stratified randomized survey was extended to the full length of the Bay. Since that time Bay stations have been sampled on an irregular basis, usually in response to a request related to dumping, or channel deepening.

York River and Tributaries

Survey data on the York River and its tributary, the Pamunkey River, are the most comprehensive, running from 1955 to 1984. In addition some data for the other tributary, the Mattaponi River are also available. Fixed stations have been taken primarily in the channel every month, at approximately 5 mile intervals, from mile -10 to 50. The exceptions occurred in 1975 to 1979 when this river was sampled twice a year summer and winter, instead of every month. The sampling during these five years was randomized, and stratified into five depth strata 3'-11', 12'-19', 20'-29', 30'-49', and 50' or over, instead of just the channel.

James River and Tributaries

Monthly sampling of fixed stations in the James River from its mouth almost to Richmond, as well as its tributaries commenced in 1964 and has continued through 1984, except for the period 1975 to 1979, when stratified randomized stations were occupied. Several tributaries of the James were also sampled on an irregular basis. These include the Chickahominy, Elizabeth, Nansemond, Warwick, Pagen, Hampton, Appomattox Rivers, Turkey Island, Jones' Neck, and Hatcher Island Oxbows. The Elizabeth River has received a considerable amount of study the last few years. Primarily with fixed stations.

Rappahannock River

Fixed stations have been sampled monthly on the Rappahannock River between 1967 and 1984, with the exception of 1975 to 1979 when randomized stratified stations were occupied. This river has been sampled from mile 0 to mile 55.

Potomac River

Fixed stations were sampled on the Potomac River from the mouth, to the restricted area off Dahlgren, and then upriver to about Quantico; between 1974 and 1984, and as randomized stations between 1975 and 1979. The Potomac is seldom sampled more than twice a year, and occasionally not at all.

Mobjack Bay and Tributaries

Occasional samples have been taken from Mobjack Bay and its tributaries, the Ware, East, and North Rivers. Some samples have been taken in the Piankatank River.

Eastern Shore Bay and Ocean Side

A two year survey was made on the Eastern shore of the Bay in 1966 and 1967. A few sporadic sample have also been taken in the ocean from the Eastern shore down to Rudee Inlet.

Species for Which Data are Available

Although a large number of species of fish, primarily juveniles, have been taken in the trawl surveys, less than ten species are taken in sufficient numbers to be useful for stock evaluation.

Sciaenids along with other Chesapeake Bay bottom fish comprise the group which are best sampled in the Bay and tributary rivers. These include: **Atlantic croaker, spot, weakfish, striped bass, white perch, summer flounder.** In addition to those commercially important species, two other species, which might prove useful as biological indicators, the **bay anchovy and hogchoker** are taken in large quantities.

List of Time Series Available

Concurrent hydrographic data have been collected along with the biological data on all juvenile fish surveys. Data collected include surface and bottom temperature, salinity, dissolved oxygen. Secchi disk, tidal condition, weather and sea state are also measured. In addition temperature data has been collected daily since 1946 at the VIMS pier. Vertical sections of temperature, salinity, and d.o. have been collected monthly during the VIMS slack water runs.

Locations of Station Data Presented in Appendices

Trawl station data presented in the appendices are specified by trawl size: Appendix A referring to the 30' trawl, Appendix B to a 16' trawl. The data in each appendix is then listed separately for each river system. Along with modifications to the trawls which occurred over time. Keys to coded data is available on request.

Locations of tabular data follow:

Columns 10-17: VIMS Fisheries Dept. collections numbers.

Columns 21-30: Date in the order of Day/Month/Year.

Columns 34-35: Vessel Codes.

Columns 39-40: Gear Code.

Columns 44-45: Duration of tow in minutes. or distance covered in miles

Columns 58-65: Area from which data was collected by stations
